APPENDIX D: JAVA PROGRAMMING CHEATSHEET

This appendix summarizes the most commonly-used Java language features in the textbook. Here are the APIs of the most common libraries.

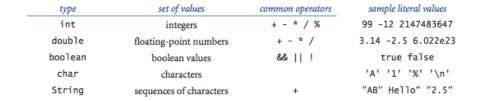

Hello, World.

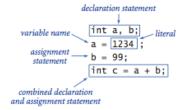

Editing, compiling, and executing.

Built-in data types.

Declaration and assignment statements.

Integers.

values	integers between -2 31 and +2 31-1				
typical literals		1234	99 -99 0	1000000	
operations	add	subtract	multiply	divide	remainder
operators	+	-	*	/	%

expression	value	comment
5 + 3	8	
5 - 3	2	
5 * 3	15	
5 / 3	1	no fractional part
5 % 3	2	remainder
1 / 0		run-time error
3 * 5 - 2	13	* has precedence
3 + 5 / 2	5	/ has precedence
3 - 5 - 2	-4	left associative
(3-5)-2	-4	better style
3 - (5 - 2)	0	unambiguous

Floating-point numbers.

values	real numbers (specified by IEEE 754 standard)				
typical literals	3.14159	6.022e23	-3.0	2.0	1.4142135623730951
operations	add	subtract	m	ultiply	divide
operators	+	-		*	/

expression	value		
3.141 + .03	3.171		
3.14103	3.111		
6.02e23 / 2.0	3.01e23		
5.0 / 3.0	1.666666666666667		
10.0 % 3.141	0.577		
1.0 / 0.0	Infinity		
Math.sqrt(2.0)	1.4142135623730951		
Math.sqrt(-1.0)	NaN		

Booleans.

values	tr	ue or fa	lse
literals	true false		
operations	and	or	not
operators	&&	П	1

a	!a	a	b	a && b	a b
true	false	false	false	false	false
false	true	false	true	false	true
		true	false	false	true
		true	true	true	true

Comparison operators.

op	meaning	true	false
	equal	2 == 2	2 == 3
!=	not equal	3 != 2	2 != 2
<	less than	2 < 13	2 < 2
<=	less than or equal	2 <= 2	3 <= 2
>	greater than	13 > 2	2 > 13
>=	greater than or equal	3 >= 2	2 >= 3

```
non-negative discriminant? (b*b - 4.0*a*c) >= 0.0
beginning of a century? (year % 100) == 0
legal month? (month >= 1) && (month <= 12)
```

Parsing command-line arguments.

```
int Integer.parseInt(String s) convert s to an int value
double Double.parseDouble(String s) convert s to a double value
long Long.parseLong(String s) convert s to a long value
```

Math library.

```
public class Math
   double abs(double a)
                                          absolute value of a
   double max(double a, double b) maximum of a and b
   double min(double a, double b) minimum of a and b
Note 1: abs(), max(), and min() are defined also for int, long, and float.
   double sin(double theta)
                                          sine function
   double cos(double theta)
                                          cosine function
   double tan(double theta)
                                          tangent function
Note 2: Angles are expressed in radians. Use toDegrees() and toRadians() to convert.
Note 3: Use asin(), acos(), and atan() for inverse functions.
   double exp(double a)
                                          exponential (ea)
   double log(double a)
                                          natural log (loge a, or ln a)
   double pow(double a, double b) raise a to the bth power (a^b)
     long round(double a)
                                          round to the nearest integer
   double random()
                                          random number in [0, 1)
   double sqrt(double a)
                                          square root of a
   double E
                                          value of e (constant)
   double PI
                                          value of \pi (constant)
                                       library
                                                                 value
              expression
                                                   type
     Integer.parseInt("123")
                                                   int
                                                                 123
                                      Integer
  Math.sqrt(5.0*5.0 - 4.0*4.0)
                                       Math
                                                 double
                                                                 3.0
           Math.random()
                                       Math
                                                 double
                                                            random in [0, 1)
       Math.round(3.14159)
                                       Math
                                                  long
                                                                  3
```

The full Math APL

Type conversion.

expression	expression type	expression value
"1234" + 99	String	"123499"
<pre>Integer.parseInt("123")</pre>	int	123
(int) 2.71828	int	2
Math.round(2.71828)	long	3
(int) Math.round(2.71828)	int	3
(int) Math.round(3.14159)	int	3
11 * 0.3	double	3.3
(int) 11 * 0.3	double	3.3
11 * (int) 0.3	int	0
(int) (11 * 0.3)	int	3

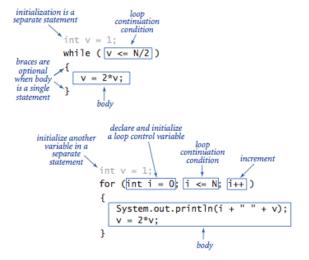

If and if-else statements.

```
if (x < 0) x = -x;
absolute value
            if (x > y)
put x and y
               int t = x;
   into
               y = x;
sorted order
               x = t;
maximum of
            if (x > y) max = x;
            else
                      max = y;
 x and y
 error check
            for division
 operation
            double discriminant = b*b - 4.0*c;
            if (discriminant < 0.0)
               System.out.println("No real roots");
 error check
for quadratic
            else
 formula
            {
               System.out.println((-b + Math.sqrt(discriminant))/2.0);
               System.out.println((-b - Math.sqrt(discriminant))/2.0);
```

Nested if-else statement.

```
if (income < 0) rate = 0.0;
else if (income < 47450) rate = .22;
else if (income < 114650) rate = .25;
else if (income < 174700) rate = .28;
else if (income < 311950) rate = .33;
else rate = .35;
```

While and for loops.

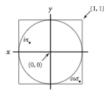

print largest power of two less than or equal to N	<pre>int v = 1; while (v <= N/2) v = 2*v; System.out.println(v);</pre>
compute a finite sum $(1+2+\ldots+N)$	<pre>int sum = 0; for (int i = 1; i <= N; i++) sum += i; System.out.println(sum);</pre>
compute a finite product $(N! = 1 \times 2 \times \times N)$	<pre>int product = 1; for (int i = 1; i <= N; i++) product *= i; System.out.println(product);</pre>
print a table of function values	<pre>for (int i = 0; i <= N; i++) System.out.println(i + " " + 2*Math.PI*i/N);</pre>
print the ruler function (see Program 1.2.1)	String ruler = " "; for (int i = 1; i <= N; i++) ruler = ruler + i + ruler; System.out.println(ruler);

Break statement.

```
int i;
for (i = 2; i <= N/i; i++)
    if (N % i == 0) break;
if (i > N/i) System.out.println(N + " is prime");
```

Do-while loop.

```
do
{
    x = 2.0*Math.random() - 1.0;
    y = 2.0*Math.random() - 1.0;
} while (Math.sqrt(x*x + y*y) > 1.0);
```

Switch statement.

```
switch (day)
{
   case 0: System.out.println("Sun"); break;
   case 1: System.out.println("Mon"); break;
   case 2: System.out.println("Tue"); break;
   case 3: System.out.println("Wed"); break;
   case 4: System.out.println("Thu"); break;
   case 5: System.out.println("Fri"); break;
   case 6: System.out.println("Sat"); break;
}
```

Arrays.

a	
а	a[0]
	a[1]
	a[2]
	a[3]
	a[4]
	a[5]
	a[6]
	a[7]

Compile-time initialization.

```
String[] suit = { "Clubs", "Diamonds", "Hearts", "Spades" };
String[] rank =
{
    "2", "3", "4", "5", "6", "7", "8", "9", "10",
    "Jack", "Queen", "King", "Ace"
};
```

Typical array-processing code.

```
double[] a = new double[N];
for (int i = 0; i < N; i++)</pre>
   create an array
 with random values
                           a[i] = Math.random();
print the array values,
one per line
                       for (int i = 0; i < N; i++)
                           System.out.println(a[i]);
                        double max = Double.NEGATIVE_INFINITY;
find the maximum of
                       for (int i = 0; i < N; i++)
  the array values
                           if (a[i] > max) max = a[i];
                       double sum = 0.0;
                       for (int i = 0; i < N; i++)
compute the average of
                          sum += a[i];
   the array values
                       double average = sum / N;
                        double[] b = new double[N];
                        for (int i = 0; i < N; i++)
copy to another array
                           b[i] = a[i];
                       for (int i = 0; i < N/2; i++)
 reverse the elements
                           double temp = b[i];
                           b[i] = b[N-1-i];
b[N-i-1] = temp;
  within an array
                       }
```

Two-dimensional arrays.

```
a[1][2]
         85 98
      99
row 1→ 98 57 78
      92 77 76
      94 32
            11
      99 34
            22
      90 46 54
      76 59 88
      92 66
            89
      97
         71
            24
      89
            38
         29
           column 2
```

Compile-time initialization.

```
int[][] a =
{
      { 99, 85, 98, 0 },
      { 98, 57, 78, 0 },
      { 92, 77, 76, 0 },
      { 94, 32, 11, 0 },
      { 99, 34, 22, 0 },
      { 90, 46, 54, 0 },
      { 76, 59, 88, 0 },
      { 92, 66, 89, 0 },
      { 97, 71, 24, 0 },
      { 89, 29, 38, 0 },
      { 9, 0, 0, 0, 0 }
};
```

Ragged arrays.

```
for (int i = 0; i < a.length; i++)
{
    for (int j = 0; j < a[i].length; j++)
        System.out.print(a[i][j] + " ");
    System.out.println();
}</pre>
```

Our standard output library.

```
    public class StdOut

    void print(String s)
    print s

    void println(String s)
    print s, followed by newline

    void println()
    print a new line

    void printf(String f, ...)
    formatted print
```

API for our library of static methods for standard output

The full StdOut API.

Anatomy of a formatted print statement

type code		typical literal		
int	d	512	"%14d" "%-14d"	" 512" "512 "
double	f e	1595.1680010754388	"%14.2f" "%.7f" "%14.4e"	" 1595.17" "1595.1680011" " 1.5952e+03"
String	5	"Hello, World"	"%14s" "%-14s" "%-14.5s"	" Hello, World" "Hello, World " "Hello "

Our standard input library.

```
public class StdIn
   boolean isEmpty()
                                   true if no more values, false otherwise
        int readInt()
                                   read a value of type int
     double readDouble()
                                   read a value of type double
       long readLong()
                                   read a value of type long
   boolean readBoolean()
                                   read a value of type boolean
       char readChar()
                                   read a value of type char
     String readString()
                                   read a value of type String
     String readLine()
                                   read the rest of the line
     String readAll()
                                   read the rest of the text
```

API for our library of static methods for standard input

The full StdIn API.

Our standard drawing library.

```
public class StdDraw
  void line(double x0, double y0, double x1, double y1)
  void point(double x, double y)
  void text(double x, double y, String s)
  void circle(double x, double y, double r)
  void filledCircle(double x, double y, double r)
  void square(double x, double y, double r)
  void filledSquare(double x, double y, double r)
  void polygon(double[] x, double[] y)
  void filledPolygon(double[] x, double[] y)
  void setXscale(double x0, double x1)
                                                reset x range to (x_0, x_1)
  void setYscale(double y0, double y1)
                                                reset y range to (y_0, y_1)
  void setPenRadius(double r)
                                                set pen radius to r
  void setPenColor(Color c)
                                                set pen color to C
  void setFont(Font f)
                                                set text font to f
  void setCanvasSize(int w, int h)
                                                set canvas to w-by-h window
  void clear(Color c)
                                                 clear the canvas; color it C
  void show(int dt)
                                                 show all; pause dt milliseconds
  void save(String filename)
                                                 save to a .jpg or w.png file
Note: Methods with the same names but no arguments reset to default values.
```

API for our library of static methods for standard drawing

The full StdDraw API.

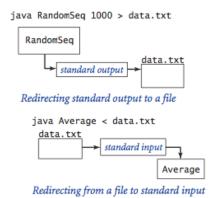

Our standard audio library.

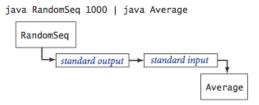

```
public class StdAudio
     void play(String file)
                                                 play the given .wav file
     void play(double[] a)
                                                 play the given sound wave
     void play(double x)
                                                 play sample for 1/44100 second
     void save(String file, double[] a) save to a .wav file
 double[] read(String file)
                                                 read from a .wav file
```

API for our library of static methods for standard audio

The full StdAudio API.

Redirection and piping.

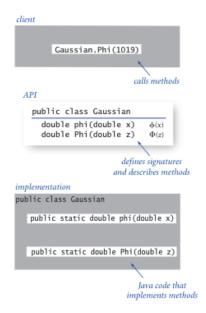

Piping the output of one program to the input of another

Functions.

```

```

Libraries of functions.

Our standard random library.

```
int uniform(int N)

double uniform(double lo, double hi)

boolean bernoulli(double p)

double gaussian()

double gaussian(double m, double s)

int discrete(double[] a)

void shuffle(double[] a)

integer between 0 and N-1

real between lo and hi

true with probability p

normal, mean 0, standard deviation 1

normal, mean m, standard deviation s

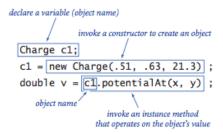

i with probability a[i]

randomly shuffle the array a[]
```

Our standard statistics library.

```
public class StdStats
   double max(double[] a)
                                         largest value
   double min(double[] a)
                                         smallest value
   double mean(double[] a)
                                         average
   double var(double[] a)
                                         sample variance
   double stddev(double[] a)
                                         sample standard deviation
   double median(double[] a)
                                         median
     void plotPoints(double[] a)
                                         plot points at (i, a[i])
     void plotLines(double[] a)
                                         plot lines connecting points at (i, a[i])
     void plotBars(double[] a)
                                         plot bars to points at (i, a[i])
```

Using an object.

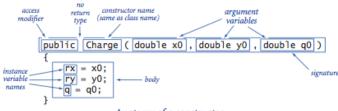

Creating an object.

Java's String data type.

public class String (Java string data type)

```
String(String s)
                                                   create a string with the same value as 5
      int length()
                                                   string length
    char charAt(int i)
                                                   ith character
                                                   ith through (j-1)st characters
  String substring(int i, int j)
 boolean contains(String sub)
                                                   does string contain sub as a substring?
 boolean startsWith(String pre)
                                                   does string start with pre?
 boolean endsWith(String post)
                                                   does string end with post?
      int indexOf(String p)
                                                   index of first occurrence of p
      int indexOf(String p, int i)
                                                   index of first occurrence of p after i
  String concat(String t)
                                                   this string with t appended
      int compareTo(String t)
                                                   string comparison
  String replaceAll(String a, String b)
                                                   result of changing as to bs
String[] split(String delim)
                                                   strings between occurrences of delim
 boolean equals(String t)
                                                   is this string's value the same as t's?
```

The full String API.

```
String a = "now is ";
String b = "the time ";
String c = "to"
                     call value
            a.length()
           a.charAt(4)
                              "w i"
  a.substring(2, 5)
b.startsWith("the")
                              true
     a.indexOf("is")
          a.concat(c)
                              "now is to"
 b.replace('t','T')
    a.split(" ")[0]
    a.split(" ")[1]
                              "The Time
                              "now"
                              "is"
           b.equals(c)
                             false
```

Java's Color data type.

public class java.awt.Color

```
Color(int r, int g, int b)

int getRed() red intensity

int getGreen() green intensity

int getBlue() blue intensity

Color brighter() brighter version of this color

Color darker() darker version of this color

String toString() string representation of this color

boolean equals(Color c) is this color's value the same as c's?
```

The full Color API.

Our input library.

In() In(String name) boolean isEmpty() int readInt() create an input stream from standard input create an input stream from a file or website true if no more input, false otherwise read a value of type int double readDouble() read a value of type double ...

Note: All operations supported by StdIn are also supported for In objects.

The full In API.

Our output library.

public class Out

```
Out()

Out(String name)

void print(String s)

void println(String s)

void println(String s)

void println()

void println()

void println()

void printf(String f, ...)

formatted print to the output stream

formatted print to the output stream

formatted print to the output stream
```

The full Out API.

Our picture library.

public class Picture

```
create a picture from a file
        Picture(String filename)
        Picture(int w, int h)
                                                  create a blank w-by-h picture
  int width()
                                                  return the width of the picture
  int height()
                                                  return the height of the picture
Color get(int x, int y)
                                                  return the color of pixel (x, y)
 void set(int x, int y, Color c)
                                                  set the color of pixel (x, y) to C
 void show()
                                                  display the image in a window
 void save(String filename)
                                                  save the image to a file
```

The full Picture API.

Compile-time and run-time errors.Here's a list of errors compiled by Mordechai Ben-Ari. It includes a list of common error message and typical mistakes that give rise to them.
